

STORY

James is a retired man in his sixties who has invested a part of his fortune in a Restaurant Chain. His restaurants are spread across Spain. Despite delegating most responsibilities to his employees (each restaurant has a director/manager, a chef and a maître as main roles), he still supervises some tasks (e.g. balance sheets, financial statements) of each restaurant in order to make decisions (e.g. staff turnover).

Among all tasks that James supervises we have focused on the **daily accounting**. Nowadays James spends a lot of time collecting accounting information from each restaurant in order to compare and making some decisions. James is not used to SAP transactions (despite his daily reports come from there) and he's very reticent to use the system. Furthermore, there are a lot of non-value reporting activities that add delay on his decision making.

So, it becomes a fantastic context to propose a **SAP Fiori App** in order to solve this **manager problem** of getting feedback of **daily accounting balance** of each business element (at this case are restaurants). By using our App, he will have all the information he needs in a unique source and he could make comparisons in an easy way: He will be able to determine the strengths and weaknesses of each restaurant (by an accounting breakdown and an employee's ranking) and decide what to do by just a few clicks.
