

STORY:

My app “Timesheet 2015” is an app, which provides any employee the opportunity to tell his line manager or client how many hours he has worked for the company/client. So this app could be for any industry and any group of customers, where it is necessary to know how many hours an employee has worked every day.

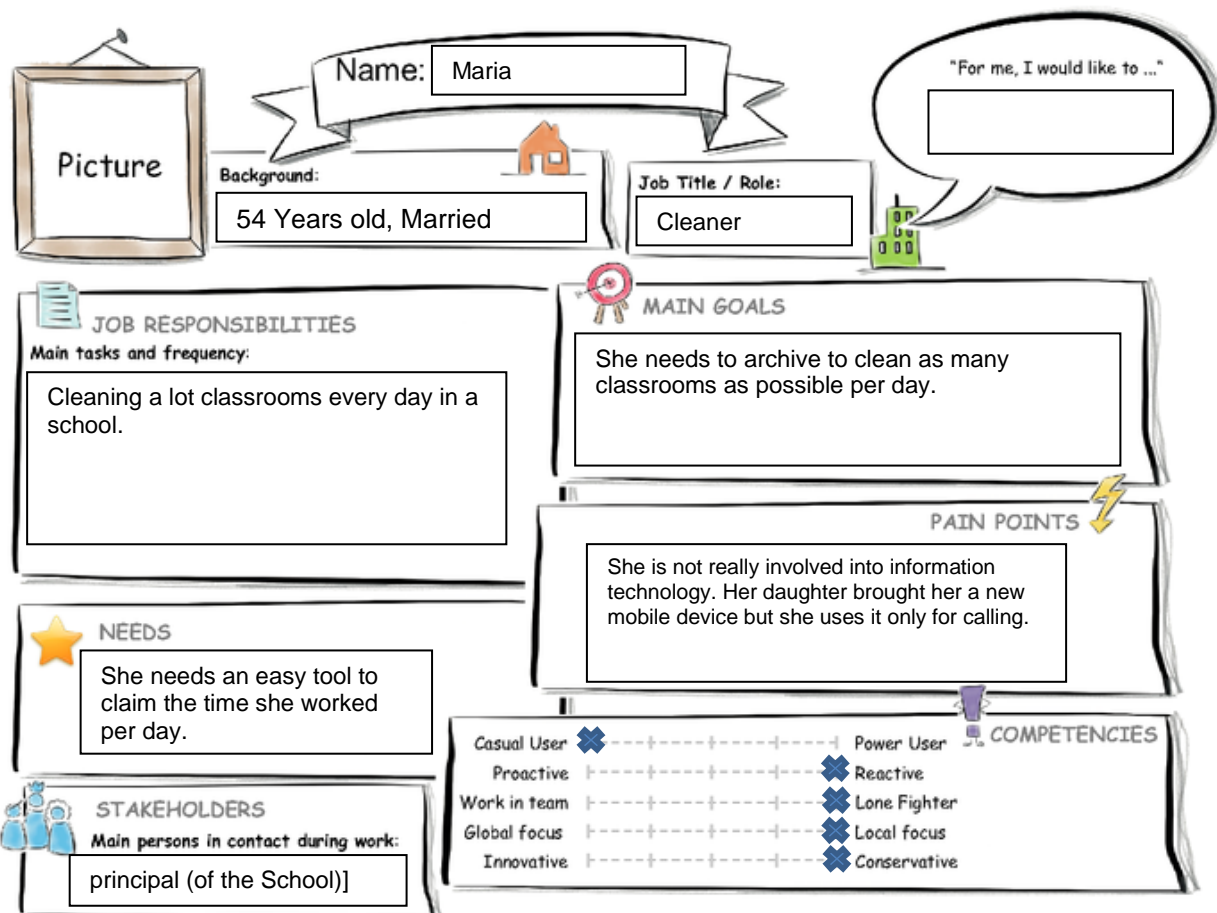

If you are a worker on a construction area, it is easy possible for you to launch the app in your iphone/android mobile device and use your fingers to input the time you have worked via the UI Control “Slider”, which is provided in the SAP UI Control libraries.

Or if you work in an office, no matter how much understanding you have in scope of information technology, this app is for you.

To achieve a good and direct understanding of how to work with the app, “Timesheet 2015” was implemented via a Master/Detail Template with an easy and light weighted Entity Data Model.

Of course, this app can be easily enhanced, for example by adding more IconTabFilters to get more specified to the customer needs.

PERSONA:

“For me, I would to...”:

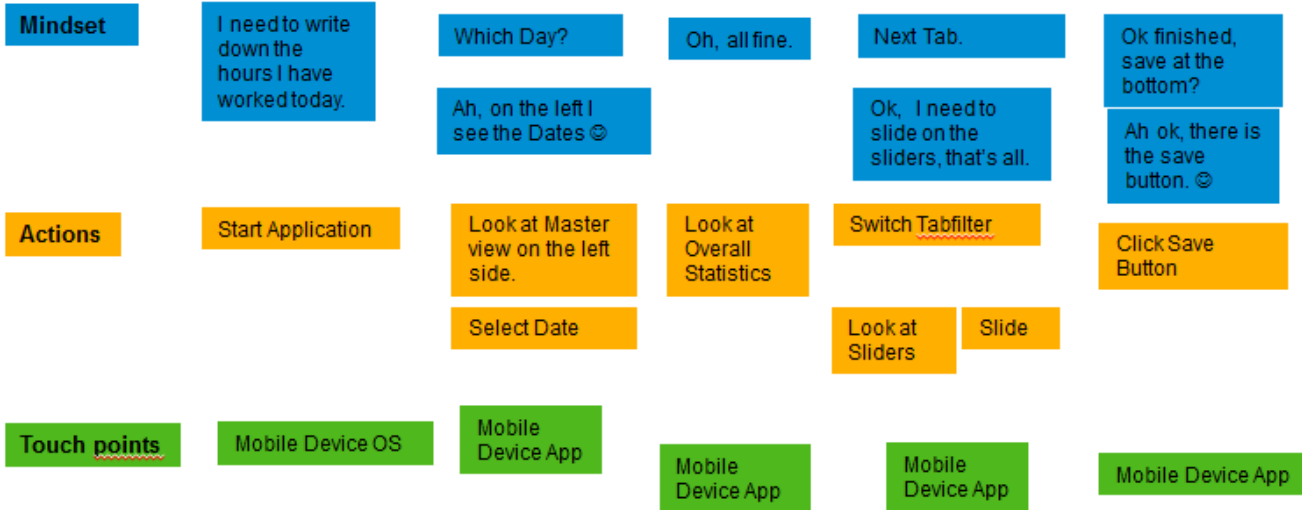

[I would like to finish my bureaucratic stuff related to my work as fast as possible.]
