

Story:

In any industry where a company builds or enhances software to fulfill the requirements of a customer, a process for estimates and quality control must be in place. It is fact that requirements change within the life of a development project. Multiple people are involved in creating these requirements, the cost estimates to meet the requirements and ensuring quality control on the side of the developing company. This means that a system is needed to handle the requirement documents, the work product estimates and enforce quality control. Email communication and lost or wrong versions of documents easily lead to misunderstandings. Estimates can therefore be based on false or old data and it also undermines quality control of the estimates as well as the individual work products

This app will deliver a coherent, fast and easy way to ensure that:

- work product estimates are made based on a specific version of a requirement documents
- quality control is enforced
- requirement versions and the estimates are traceable

This app will address the developer’s side which will allow him to create estimates based on a versioned requirements document. It will ensure a review of the estimates by quality control is done before time can be billed to the cost center / cost element of the work product being estimated.
